High Level Languages for GPUs Overview

Mike Houston

Stanford University

High Level Shading Languages

- **"Old School"**
  - Use shading language along with OpenGL/DirectX
- **Cg, HLSL, & OpenGL Shading Language**
  - Cg:
    - http://www.nvidia.com/cg
  - HLSL:
    - http://msdn.microsoft.com/library/default.asp?url=/library/en-us/directx9_c/directx/graphics/reference/highlevellanguageshaders.asp
  - OpenGL Shading Language:
    - http://www.3dlabs.com/support/developer/ogl2/whitepapers/index.html

Compilers: CGC & FXC

- **HLSL and Cg are syntactically almost identical**
  - Exception: Cg 1.3 allows shader “interfaces”, unsized arrays
- **Command line compilers**
  - Microsoft’s fxc.exe
    - Compiles to DirectX vertex and pixel shader assembly only
    - fxc /Tps_3_0 myshader.hlsl
  - NVIDIA’s cgc.exe
    - Compiles to everything
    - cgc -profile ps_3_0 myshader.cg
  - Can generate very different assembly!
    - Driver will recompile code
  - Compliance may vary

GPGPU Languages

SIGGRAPH2007

- **Why do you want them?**
  - Make programming GPUs easier!
    - Don't need to know OpenGL, DirectX, or ATI/NV extensions
    - Simplify common operations
    - Focus on the algorithm, not on the implementation
- **Accelerator**
  Microsoft Research
  http://research.microsoft.com/research/downloads/
- **Brook**
  Stanford University
  http://graphics.stanford.edu/projects/brookgpu
- **CTM**
  ATI/AMD
  http://ati.amd.com/companyinfo/researcher/documents.html
- **CUDA**
  NVIDIA
  http://www.nvidia.com/object/cuda.html
- **Peakstream**
  http://www.peakstreaminc.com
- **RapidMind**
  Commercial follow-on to Sh
  http://www.rapidmind.net

GPGPU

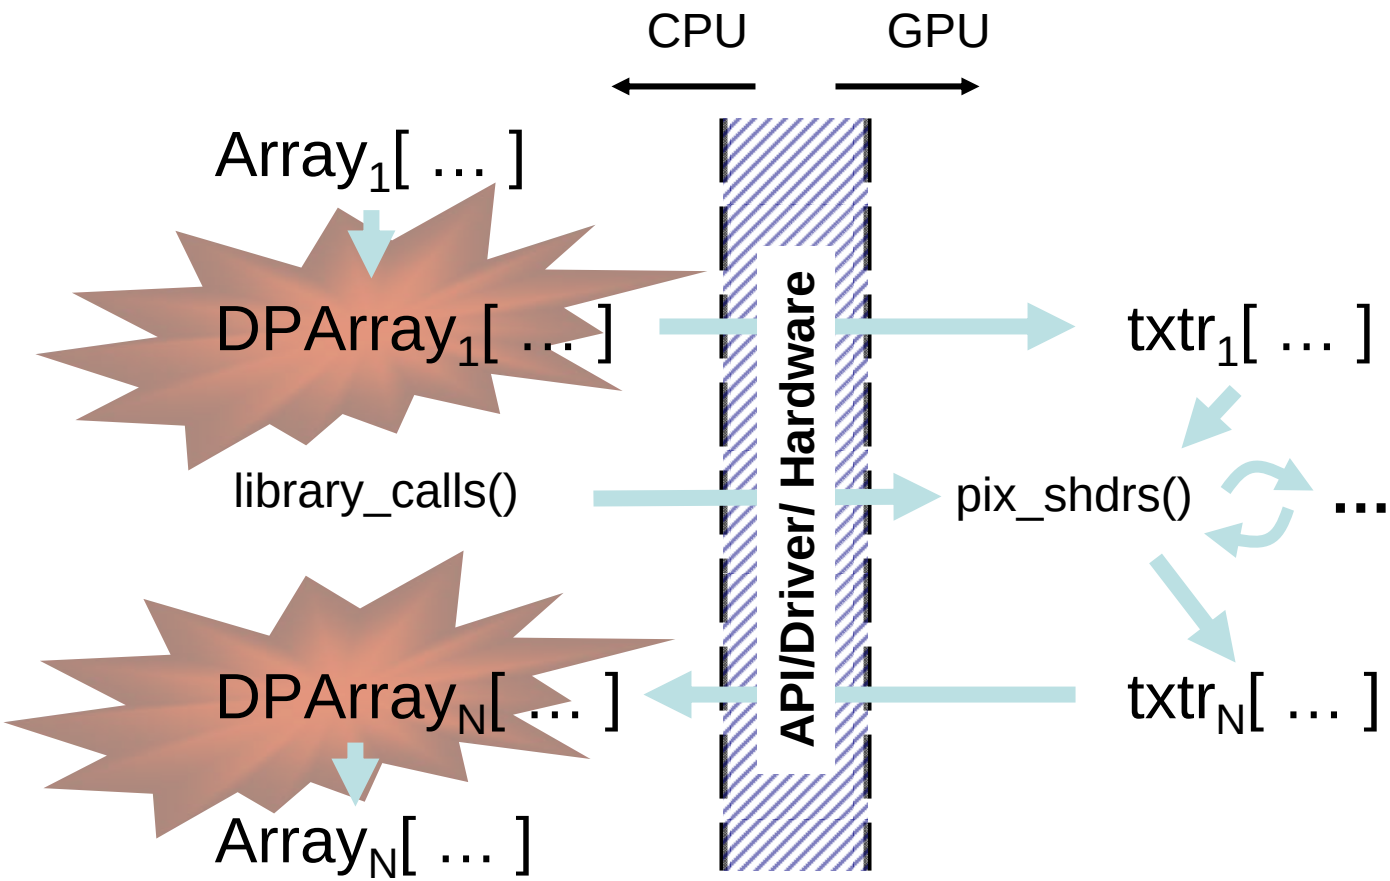
Microsoft Research Accelerator Project

- **GPGPU programming using data parallelism**
- **Presents a data-parallel library to the programmer.**
  - Simple, high-level set of operations
- **Library just-in-time compiles to GPU pixel shaders or CPU code.**
  - Runs on top of .NET

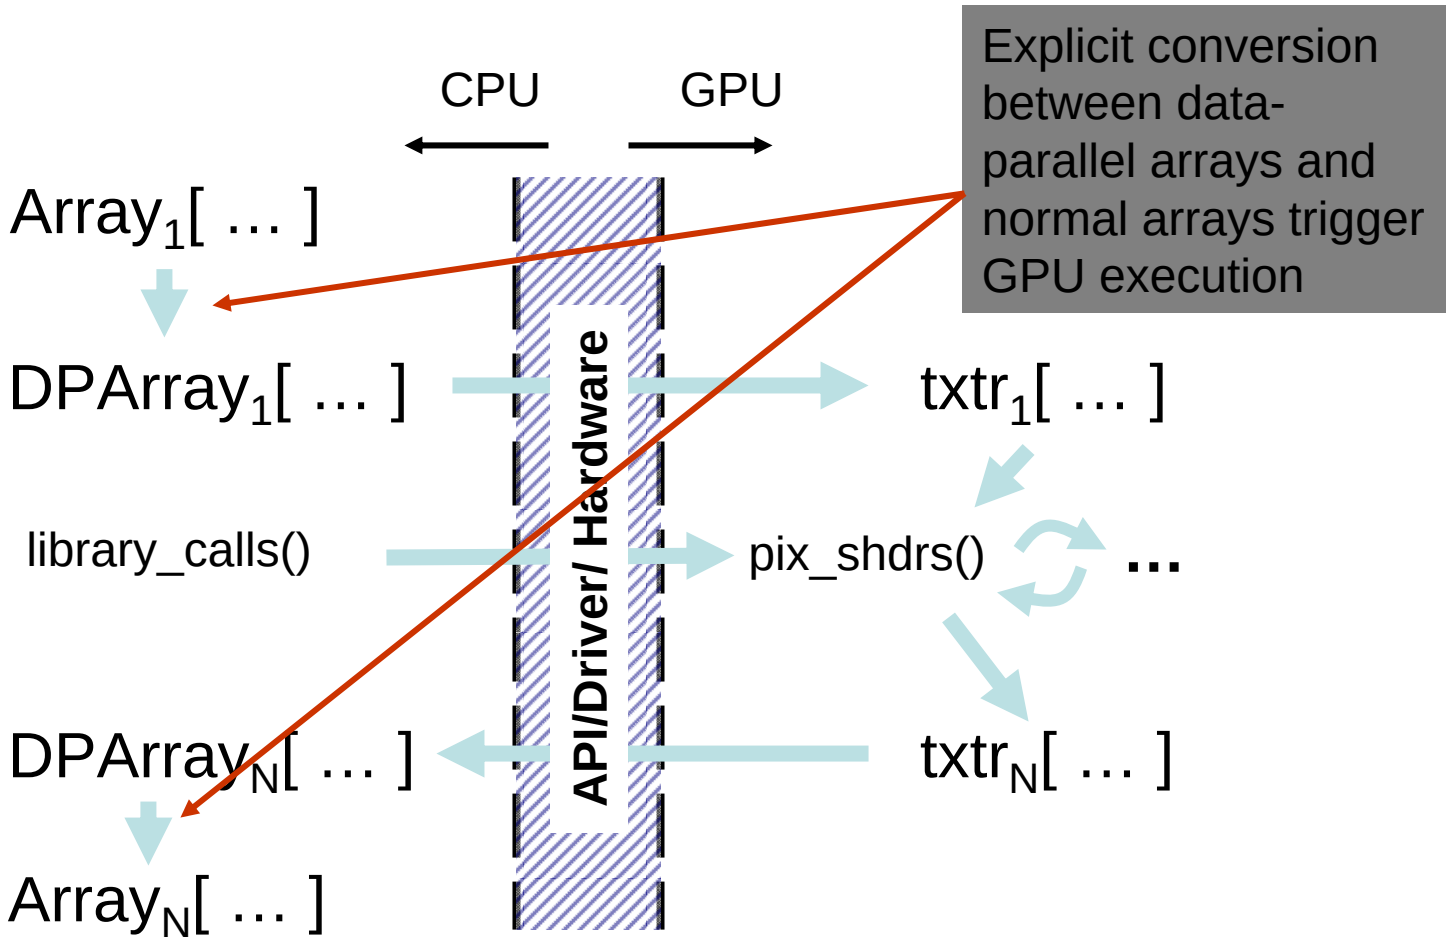
Data-parallel array library

- **Explicit conversions between data-parallel arrays and normal arrays**
- **Functional: each operation produces a new data-parallel array.**
- **Eliminate certain operations on arrays to make them data-parallel**
  - No aliasing, pointer arithmetic, individual element access

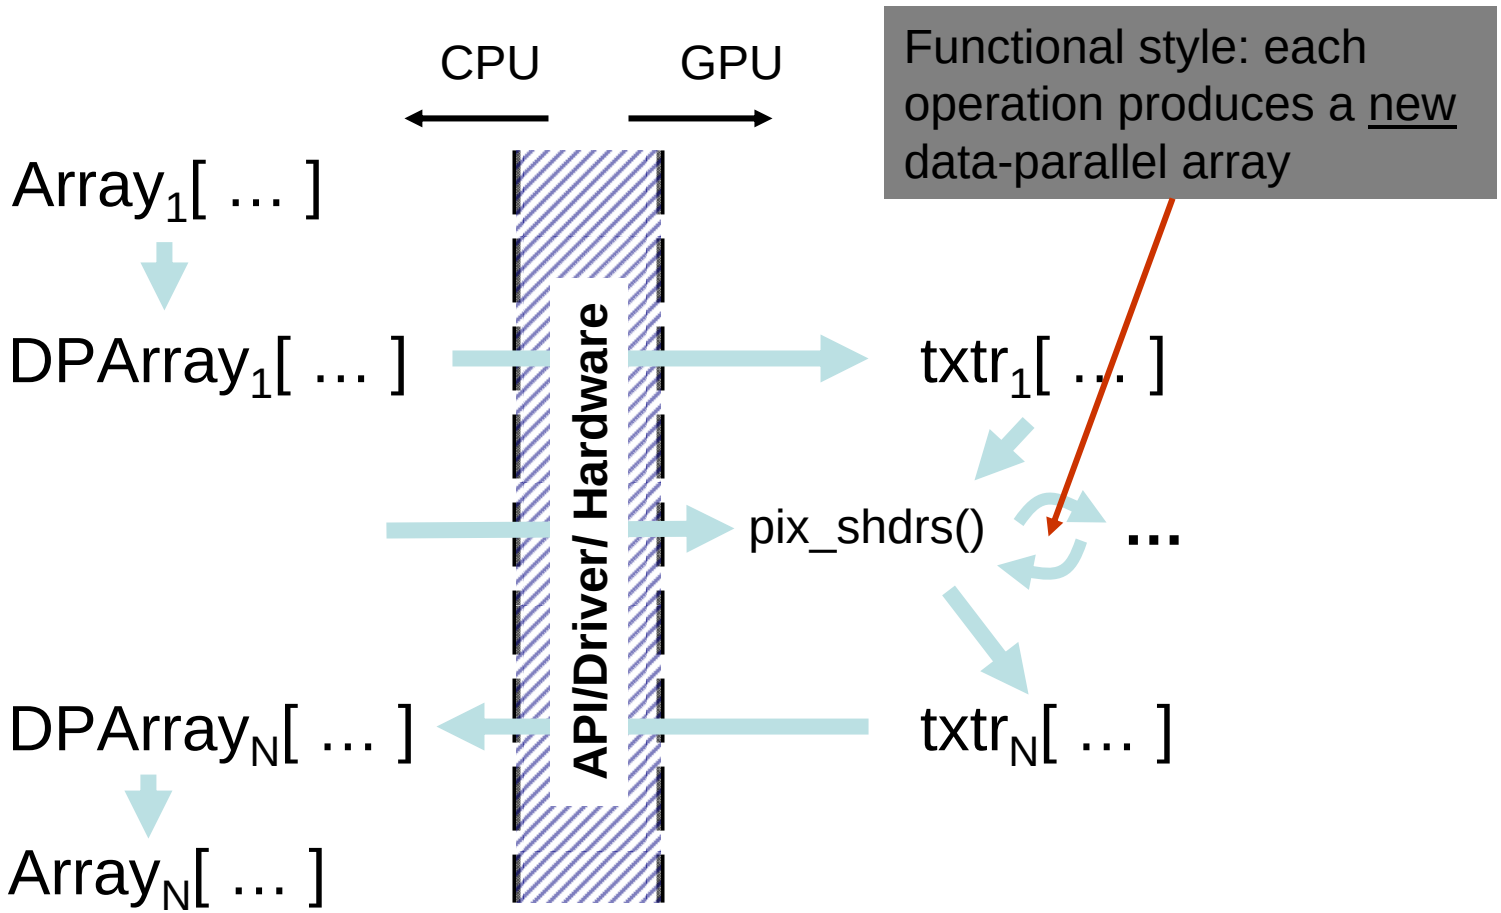
Data-parallel array types



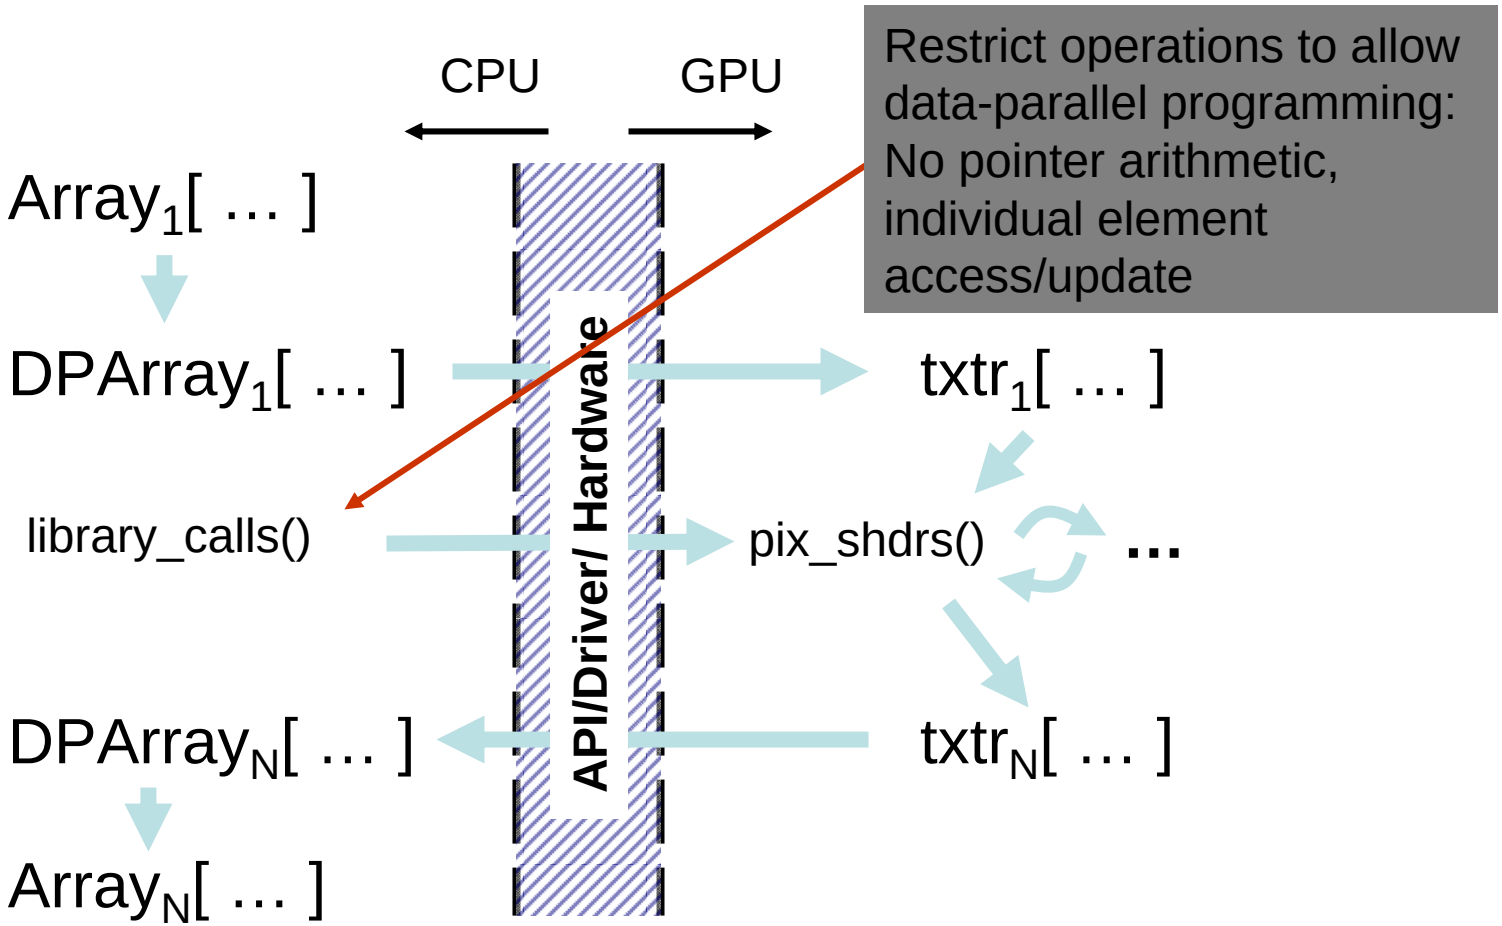
Explicit conversion



Functional style



Types of operations



Operations

- Array creation
- Element-wise arithmetic operations: +, *, -, etc.
- Element-wise boolean operations: and, or, >, < etc.
- Type conversions: integer to float, etc.
- Reductions/scans: sum, product, max, etc.
- Transformations: expand, pad, shift, gather, scatter, etc.
- Basic linear algebra: inner product, outer product.

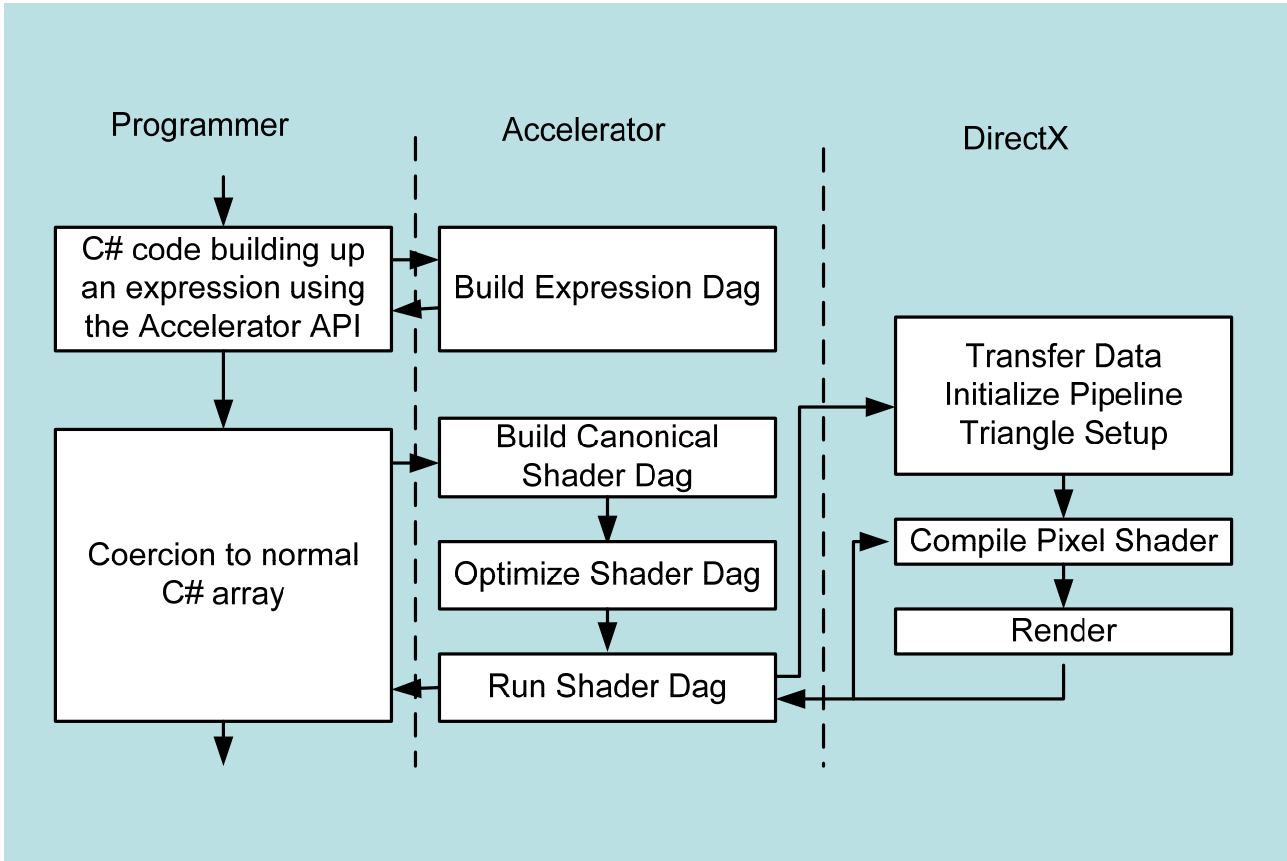
Example: 2-D convolution

SIGGRAPH2007

```
float[,] Blur(float[,] array, float[] kernel) {
        using (DFPA parallelArray = new DFPA(array)) {
            FPA resultX = new FPA(0.0f, parallelArray.Shape);
            for (int i = 0; i < kernel.Length; i++) {     // Convolve in X direction.
                resultX += parallelArray.Shift(0,i) * kernel[i];
            }
            FPA resultY = new FPA(0.0f, parallelArray.Shape);
            for (int i = 0; i < kernel.Length; i++) {    // Convolve in Y direction.
                resultY += resultX.Shift(i,0) * kernel[i];
            }
            using (DFPA result = resultY.Eval()) {
                float[,] resultArray;
                result.ToArray(out resultArray);
                return resultArray;
            }
        }
    }
```

GPGPU

Just-in-time compiler



Availability and more information

- **Binary version of Accelerator available for download**
  - http://research.microsoft.com/downloads
- **Available for non-commercial use**
  - Meant to support research community use.
  - Licensing for commercial use possible.
- **Includes documentation and a few samples**
- **Runs on Microsoft.NET, most GPUs shipping since 2002.**
- **More information:**
  - ASPLOS 2006 "Accelerator: using data-parallelism to program GPUs for general-purpose uses", David Tarditi, Sidd Puri, Jose Oglesby
  - http://research.microsoft.com/act

Brook: General Purpose Streaming Language

- **Stream programming model**
  - GPU = streaming coprocessor
- **C with stream extensions**
- **Cross platform**
  - ATI & NVIDIA
  - OpenGL, DirectX, CTM
  - Windows & Linux

Streams

- **Collection of records requiring similar computation**
  - particle positions, voxels, FEM cell, …

```
Ray r<200>;
float3 velocityfield<100,100,100>;
```

- **Similar to arrays, but…**
  - index operations disallowed: `position[i]`
  - read/write stream operators

```
streamRead (r, r_ptr);
streamWrite (velocityfield, v_ptr);
```

Kernels

- **Functions applied to streams**
  - similar to for_all construct
  - no dependencies between stream elements

```
kernel void foo (float a<>, float b<>,
                 out float result<>) {
  result = a + b;
}

float a<100>;
float b<100>;
float c<100>;

foo(a,b,c);
```

```
for (i=0; i<100; i++)
      c[i] = a[i]+b[i];
```

Kernels

- **Kernel arguments**
  - input/output streams

```
kernel void foo (float a<>,
                 float b<>,
                 out float result<>) {
   result = a + b;
}
```

Kernels

- **Kernel arguments**
  - input/output streams
  - gather streams

```
kernel void foo (..., float array[] ) {
      a = array[i];
}
```

Kernels

- **Kernel arguments**
  - input/output streams
  - gather streams
  - iterator streams

```
kernel void foo (..., iter float n<> ) {
      a = n + b;
}
```

Kernels

- **Kernel arguments**
  - input/output streams
  - gather streams
  - iterator streams
  - constant parameters

```
kernel void foo (..., float c ) {
      a = c + b;
}
```

Reductions

- **Compute single value from a stream**
  - associative operations only

```
reduce void sum (float a<>,
                 reduce float r<>)
  r += a;
}

float a<100>;
float r;

sum(a,r);
```

```
r = a[0];
for (int i=1; i<100; i++)
  r += a[i];
```

Reductions

SIGGRAPH2007

- **Multi-dimension reductions**
  - stream “shape” differences resolved by reduce function

```
reduce void sum (float a<>,
                 reduce float r<>)
  r += a;
}
```

```
float a<20>;
float r<5>;

sum(a,r);
```

```
for (int i=0; i<5; i++)
  r[i] = a[i*4];
  for (int j=1; j<4; j++)
    r[i] += a[i*4 + j];
```

GPGPU

Stream Repeat & Stride

SIGGRAPH2007

- **Kernel arguments of different shape**
  - resolved by repeat and stride

```
kernel void foo (float a<>, float b<>,
                 out float result<>);

float a<20>;
float b<5>;
float c<10>;

foo(a,b,c);
```

```
foo(a[0],  b[0], c[0])
foo(a[2],  b[0], c[1])
foo(a[4],  b[1], c[2])
foo(a[6],  b[1], c[3])
foo(a[8],  b[2], c[4])
foo(a[10], b[2], c[5])
foo(a[12], b[3], c[6])
foo(a[14], b[3], c[7])
foo(a[16], b[4], c[8])
foo(a[18], b[4], c[9])
```

GPGPU

Matrix Vector Multiply

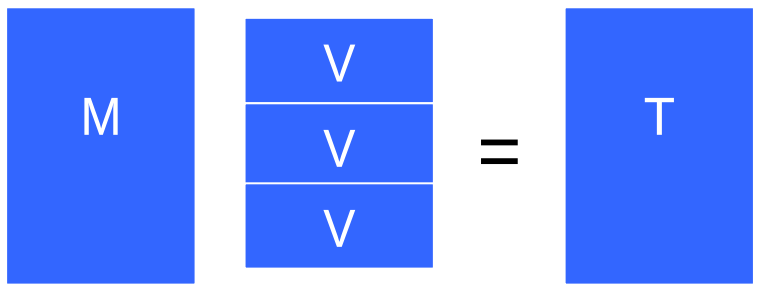
SIGGRAPH2007

```
kernel void mul (float a<>, float b<>,
                 out float result<>) {
   result = a*b;
}

reduce void sum (float a<>,
                 reduce float result<>) {
   result += a;
}

float matrix<20,10>;
float vector<1, 10>;
float tempmv<20,10>;
float result<20, 1>;

mul(matrix,vector,tempmv);
sum(tempmv,result);
```



GPGPU

Matrix Vector Multiply

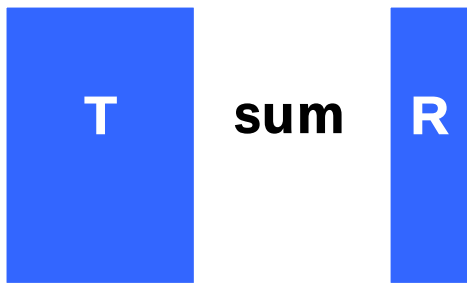
SIGGRAPH2007

```
kernel void mul (float a<>, float b<>,
                 out float result<>) {
   result = a*b;
}

reduce void sum (float a<>,
                 reduce float result<>) {
   result += a;
}

float matrix<20,10>;
float vector<1, 10>;
float tempmv<20,10>;
float result<20, 1>;

mul(matrix,vector,tempmv);
sum(tempmv,result);
```



GPGPU

Runtime

SIGGRAPH2007

- **Accessing stream data for graphics aps**
  - Brook runtime api available in C++ code
  - autogenerated .hpp files for brook code

```
brook::initialize( "dx9", (void*)device );

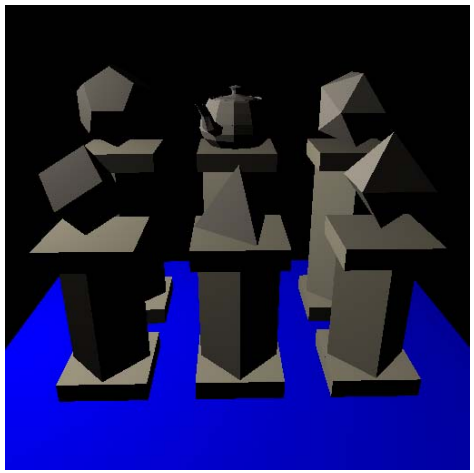
// Create streams
fluidStream0 = stream::create<float4>( kFluidSize, kFluidSize );
normalStream = stream::create<float3>( kFluidSize, kFluidSize );

// Get a handle to the texture being used by
// the normal stream as a backing store
normalTexture = (IDirect3DTexture9*)
                 normalStream->getIndexedFieldRenderData(0);

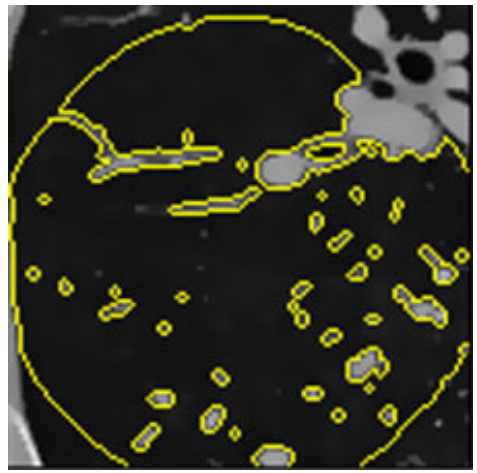
// Call the simulation kernel
simulationKernel( fluidStream0, fluidStream0, controlConstant,
                  fluidStream1 );
```

GPGPU

Applications



ray-tracer

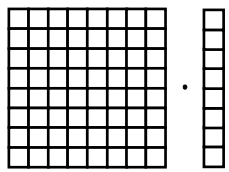


segmentation

fft edge detect

SAXPY

SGEMV



linear algebra

Brook for GPUs

- **Release v0.3 available on Sourceforge**
  - CVS tree *much* more up to date
- **Project Page**
  - http://graphics.stanford.edu/projects/brook
- **Source**
  - http://www.sourceforge.net/projects/brook
- Paper:

  Brook for GPUs: Stream Computing on Graphics Hardware

  Ian Buck, Tim Foley, Daniel Horn, Jeremy Sugerman, Kayvon Fatahalian, Mike Houston, Pat Hanrahan

CTM – AMD

- **See Justin Hensley's talk to follow**
- **Web information**
  - http://ati.amd.com/companyinfo/researcher/documents.html
  - http://ati.amd.com/companyinfo/researcher/documents/ATI_CTM_Guide.pdf

CUDA - NVIDIA

- **See Ian Buck's talk to follow**
- **Web information**
  - http://www.nvidia.com/object/cuda.html

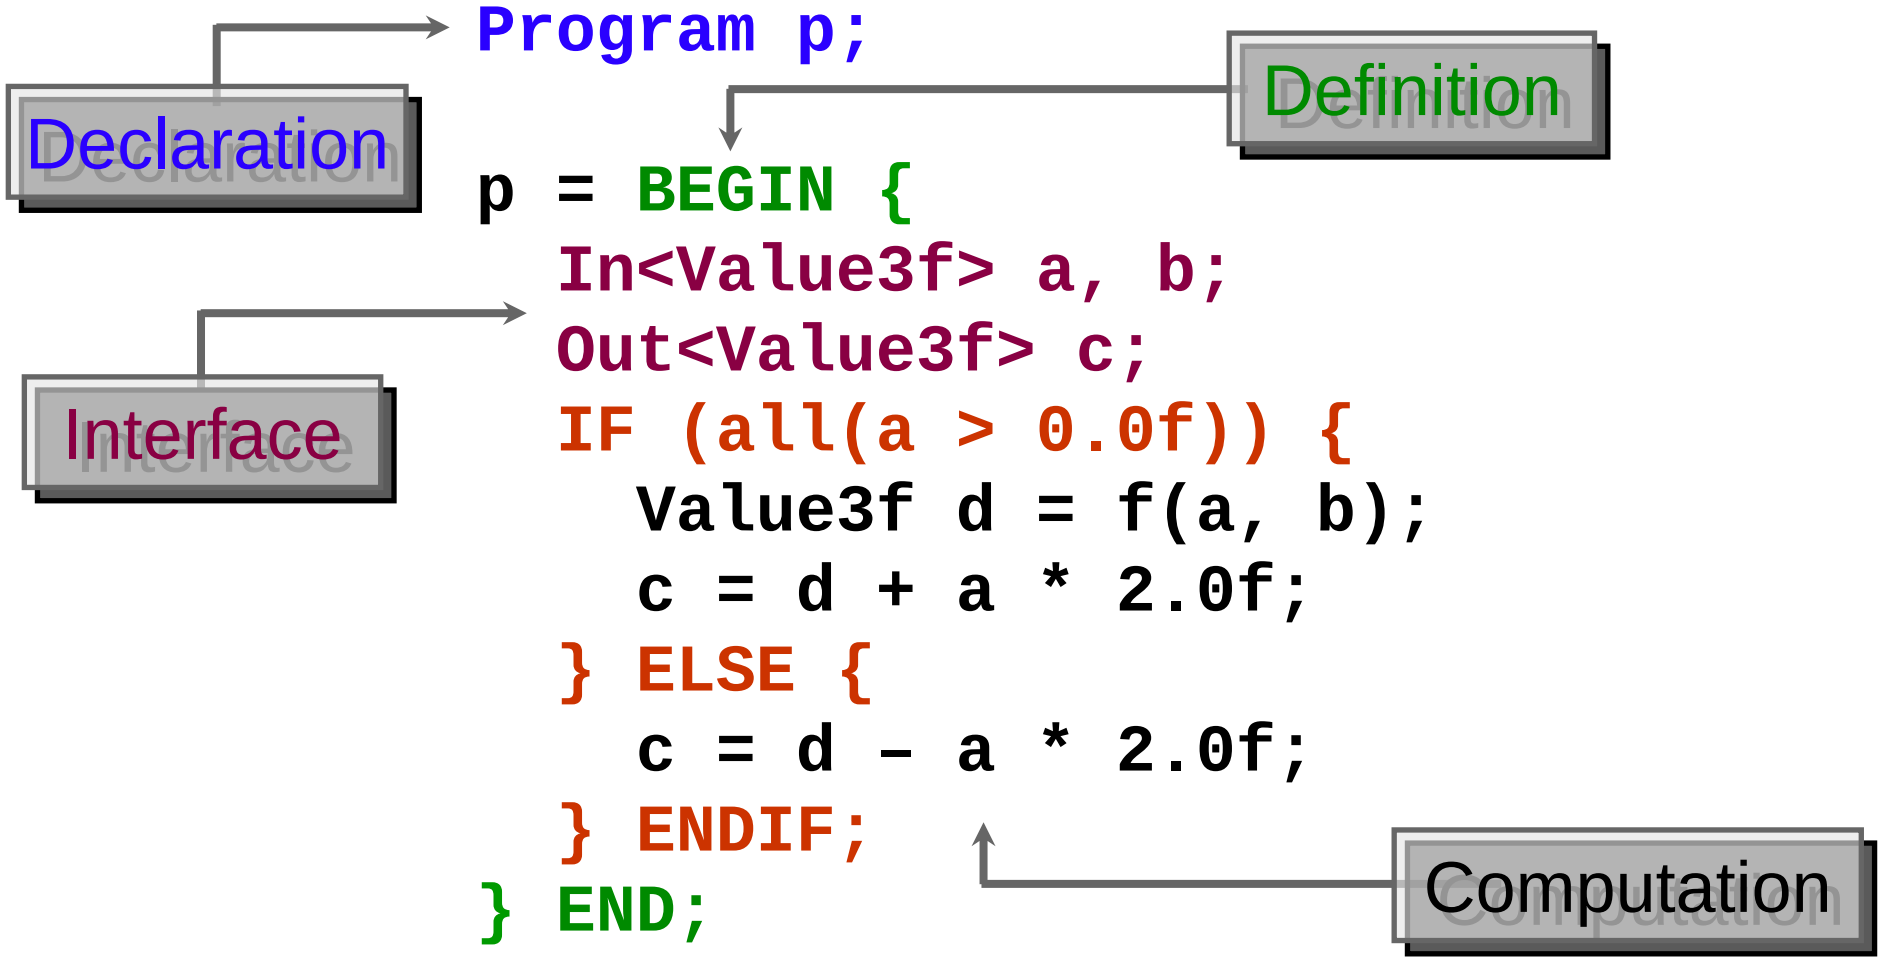
PeakStream

- **http://www.peakstreaminc.com**
- **C/C++ library based**
  - Extended operators
  - Array types
- **Full development stack**
  - Compiler
  - Profiler
  - Debugger
- **Portability through virtual machine**
  - GPU and multi-core support

Introduction to RapidMind

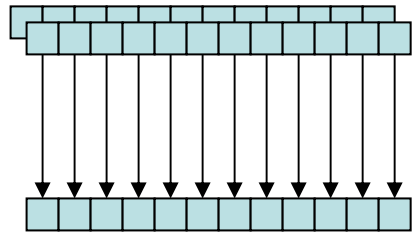
- **http://www.rapidmind.net**
- **A software development platform for multi-core and stream processors, such as GPUs and the Cell Broadband Engine**
- **Embedded within ISO Standard C++**
  - No new tools, compilers, preprocessors, etc.
- **Portable core**
  - Exposes platform specific functionality to also allow tuning for specific platforms
- **Integrates with existing programming models**

Program Definition

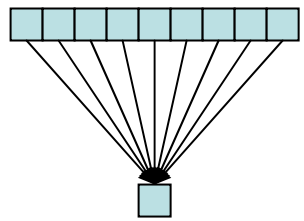


SPMD Data Parallel Programming Model

- **Parallel application:**
  - Returns a new array: `C = p(A,B)`
  - *Programs may have control flow*
  - *Programs may perform random reads from other arrays*



- **May operate on subarrays**
- **Collective operations:**
  - Reduce: `a = reduce(p,A)`
  - Gather: `A = B[U]`
  - Scatter: `A[U] = B;`
  - *others…*



Reduce

Step 1: Replace Types

```
#include <cmath>

float f;
float a[512][512][3];
float b[512][512][3];

float func(
 float r, float s
) {
 return (r + s) * f;
}

void func_arrays() {
 for (int x = 0; x<512; x++) {
  for (int y = 0; y<512; y++) {
   for (int k = 0; k<3; k++) {
    a[y][x][k] =
      func(a[y][x][k],b[y][x][k]);
   }
  }
 }
}
```

```
#include <rapidmind/platform.hpp>

Value1f f;
Array<2,Value3f> a(512,512);
Array<2,Value3f> b(512,512);

Value3f func(
 Value3f r, Value3f s
) {
 return (r + s) * f;
}
```

Step 2: Capture Computation

```
#include <cmath>

float f;
float a[512][512][3];
float b[512][512][3];

float func(
 float r, float s
) {
 return (r + s) * f;
}

void func_arrays() {
 for (int x = 0; x<512; x++) {
  for (int y = 0; y<512; y++) {
   for (int k = 0; k<3; k++) {
    a[y][x][k] =
      func(a[y][x][k],b[y][x][k]);
   }
  }
 }
}
```

```
#include <rapidmind/platform.hpp>

Value1f f;
Array<2,Value3f> a(512,512);
Array<2,Value3f> b(512,512);

Value3f func(
 Value3f r, Value3f s
) {
 return (r + s) * f;
}

void func_arrays() {
 Program func_prog = BEGIN {
  In<Value3f> r, s;
  Out<Value3f> q;
  q = func(r,s);
 } END;
 . . .
}
```

GPGPU

SIGGRAPH2007

Step 3: Parallel Execution

SIGGRAPH2007

```
#include <cmath>

float f;
float a[512][512][3];
float b[512][512][3];

float func(
 float r, float s
) {
 return (r + s) * f;
}

void func_arrays() {
 for (int x = 0; x<512; x++)
  for (int y = 0; y<512; y++) {
   for (int k = 0; k<3; k++) {
    a[y][x][k] =
      func(a[y][x][k],b[y][x][k]);
   }
  }
 }
}
```

```
#include <rapidmind/platform.hpp>

Value1f f;
Array<2,Value3f> a(512,512);
Array<2,Value3f> b(512,512);

Value3f func(
 Value3f r, Value3f s
) {
 return (r + s) * f;
}

void func_arrays() {
 Program func_prog = BEGIN {
  In<Value3f> r, s;
  Out<Value3f> q;
  q = func(r,s);
 } END;
 a = func_prog(a,b);
}
```

GPGPU

Usage Summary

- **Usage:**
  - Include platform header
  - Link to runtime library
- **Data:**
  - Value tuples
  - Arrays
  - *Remote data abstraction*
- **Programs:**
  - Defined dynamically
  - Execute on coprocessors
  - *Remote procedure abstraction*

```
#include <rapidmind/platform.hpp>

Value1f f;
Array<2,Value3f> a(512,512);
Array<2,Value3f> b(512,512);

Value3f func(
 Value3f r, Value3f s
) {
  return (r + s) * f;
}

void func_arrays() {
 Program func_prog = BEGIN {
  In<Value3f> r, s;
  Out<Value3f> q;
  q = func(r,s);
 } END;
 a = func_prog(a,b);
}
```

Summary

- **Complete standard library**
- **Full C++ integration**
- **Expresses general purpose computations**
- **Multiple platforms**
  - Multi-core
  - Cell
  - GPUs

- **Application spaces:**
  - Financial modeling
  - Image processing
  - Oil and Gas
  - Scientific Computation
  - Content Creation
- **Example applications:**
  - FFT
  - BLAS
  - Black-Scholes
  - Raytracing
  - Crowd simulation
  - Shape detection
  - Sorting
  - Coupled Map Lattice Simulation
