

Organic Chemistry and the Diels-Alder Reaction

Christine Rovani
Fall 2012
Math 198

Organic Chemistry Background

- Structure, properties, composition, reactions, and preparation of carbon-based compounds
- May contain other atoms:
 - > hydrogen
 - > oxygen
 - > nitrogen
 - > halogens (fluorine, chlorine, bromine, iodine)
 - > others too!

Periodic Table!

The periodic table is color-coded by groups: Group 1 (blue), Group 2 (red), Groups 3-10 (yellow), Group 11 (light blue), Group 12 (cyan), p-block (various colors: B is purple, C, N, O, Se are green, F is pink, Si is purple, P is green, S is green, Cl is pink, Ar is orange, Ge is purple, As is purple, Sb is purple, Te is purple, I is pink, Br is pink, Kr is orange, Sn is cyan, Bi is cyan, Po is purple, At is pink, Rn is orange), and Groups 13-18 (orange). Two red circles highlight Hydrogen (H) and the p-block elements.

H																		He
Li	Be											B	C	N	O	F	Ne	
Na	Mg											Al	Si	P	S	Cl	Ar	
K	Ca	Sc	Ti	V	Cr	Mn	Fe	Co	Ni	Cu	Zn	Ga	Ge	As	Se	Br	Kr	
Rb	Sr	Y	Zr	Nb	Mo	Tc	Ru	Rh	Pd	Ag	Cd	In	Sn	Sb	Te	I	Xe	
Cs	Ba		Hf	Ta	W	Re	Os	Ir	Pt	Au	Hg	Tl	Pb	Bi	Po	At	Rn	
Fr	Ra		Rf	Db	Sg	Bh	Hs	Mt	Uun	Uuu	Uub							
		La	Ce	Pr	Nd	Pm	Sm	Eu	Gd	Tb	Dy	Ho	Er	Tm	Yb	Lu		
		Ac	Th	Pa	U	Np	Pu	Am	Cm	Bk	Cf	Es	Fm	Md	No	Lr		

More Background

- ◉ Range of applications for organic compounds is immense
 - > Plastics
 - > Drugs (pharmaceuticals and others)
 - > Petrochemicals
 - > Food
 - > Explosives
 - > Paint
 - > More!

Organic Reactions

Basic reactions:

- > Addition
- > Substitution
- > Elimination
- > Rearrangement
- > Photochemical
- > Redox

Diels-Alder Reaction

- Addition reaction
 - > cycloaddition
 - > pericyclic

- Reaction between a **diene** and a **dienophile** to form a substituted **cyclohexene**
 - > **diene**: hydrocarbon that contains two double bonds
 - > **dienophile**: unsaturated hydrocarbon, has at least one C=C double bond
 - > **cyclohexene**: six membered carbon ring with one C=C double bond

Requirements

- Good dienophile

- > Not simple alkenes or alkynes
- > One or more electron-withdrawing carbonyl groups (oxygen) or cyano groups (nitrogen)

- > These groups pull electron density away from the C=C double bond, making it more likely to react.

Dienes and Dienophiles

- Good dienes:

- Good dienophiles:

Reaction Continued

- Conformation of **diene**: needs to be s-cis
NOT s-trans

s-trans

s-cis

More Requirements

- Heat! Reaction can't run without an initial push to overcome the activation energy

What is a pericyclic reaction anyways?

- Most organic reactions go through a *transition state* where a *carbocation intermediate* is formed
- A pericyclic reaction occurs when there is NO intermediate formed. The reaction progresses in a *concerted* fashion, and the result is a cyclic molecule.

More about Diels-Alder!

- Otto Paul Hermann Diels and Kurt Alder first documented the reaction in 1928
- They were awarded the Nobel Prize in Chemistry in 1950 for their work on the new reaction.
- Generally considered one of the more useful reactions in organic chemistry since it requires very little energy to create a *cyclohexene ring*, which is useful in many other organic reactions.

Example: Eucalyptus Oil

- The Diels-Alder reaction is used to create the active ingredient in synthetic *Eucalyptus dives* oil, which is used in Bengay and similar products

Interesting Fact!

- ◉ Interestingly, many Diels-Alder reactions occur much faster in water than in organic solvents. Scientists are still working on finding out why aqueous environment accelerates this reaction.

Use of Diels-Alder

- Incorporating Highly Efficient Polyenic Chromophores into Maleimide-Containing Side-Chain Polymers for Electro-Optics
