Update F10

This week I have finished my fairly intensive study of VPython and the visual library. I have analyzed numerous examples and written my own variations of them (especially the particle physics ones). I relied on vpython.org to help me learn the different functions, objects, attributes, etc…

The purpose of dedicating this time to acclimating myself to the program is to allow me to progress rapidly and without hesitation when composing the actual program for the double slit experiment.

Next week, I will start the construction of the experiment setup.
